

Guidelines - Model Deployment via Streamlit and GitHub

Step 1. Create a GitHub account

Go to github.com and click Sign Up. Pick a username, enter your email, set a password, and verify your email through the confirmation link they send you. That's it, you now have a GitHub account.

If you already have one, skip this.

Step 2. Create a GitHub repository and upload the artifacts

Go to github.com/new and create a public GitHub repository and upload the provided deployment files using the GitHub web interface (drag and drop or upload files). Once the upload is complete, verify that all the deployment files are visible in the repository.

Cancel

Step 3. Create a Streamlit Community Cloud account

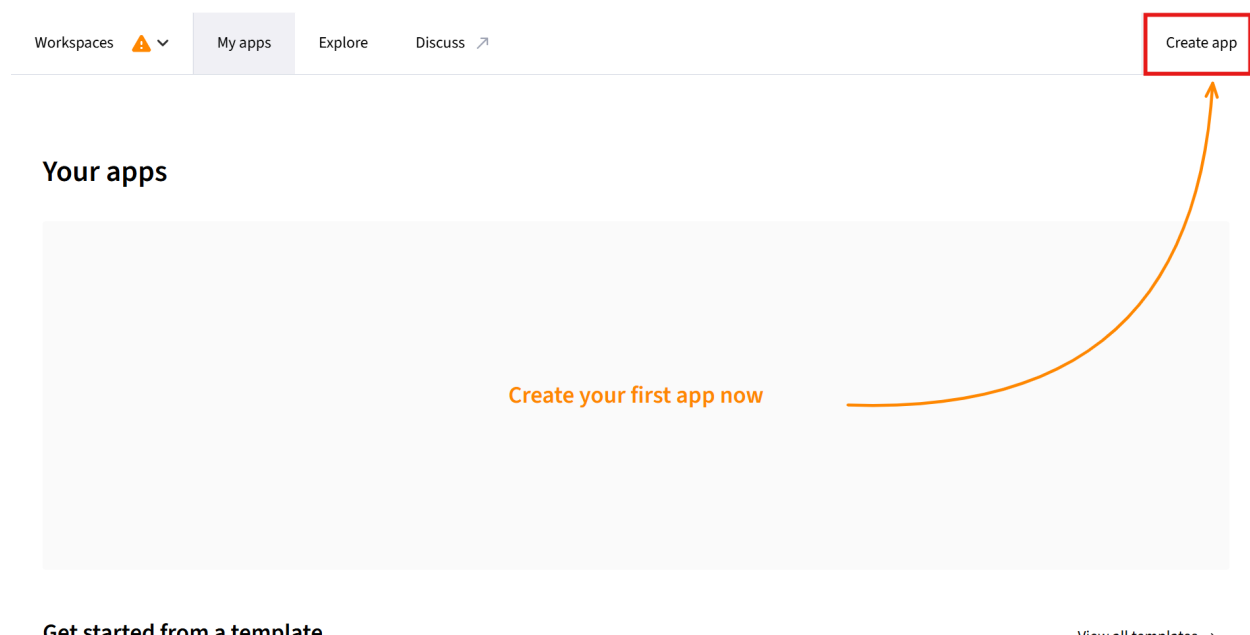

Head over to share.streamlit.io.

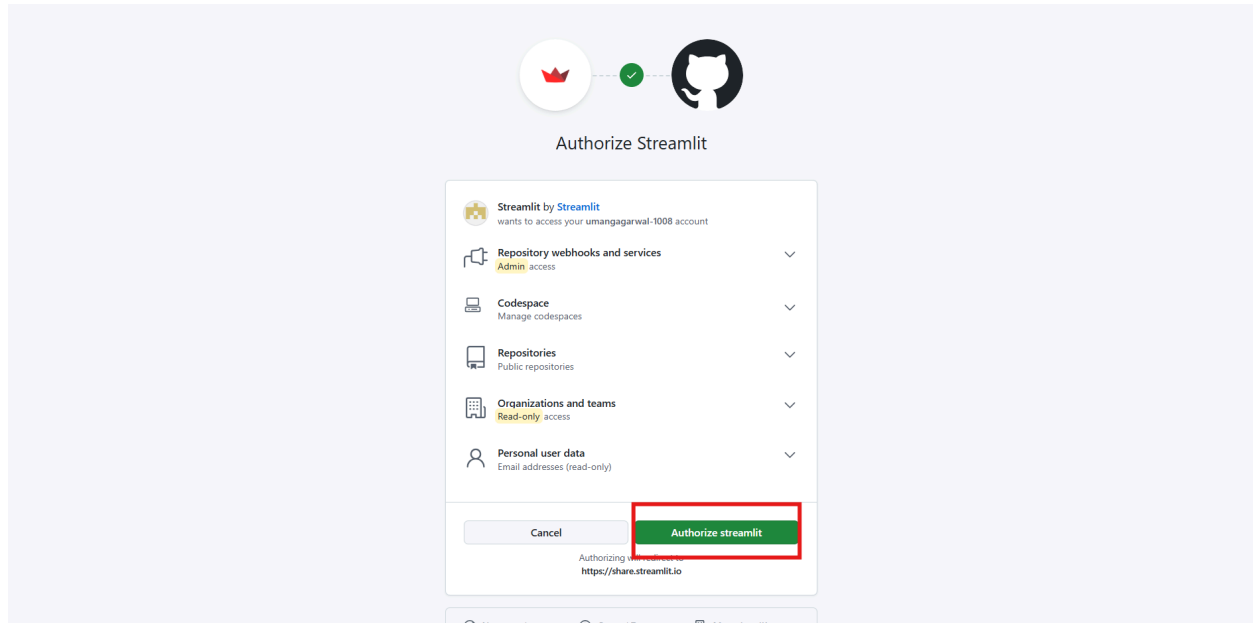

Sign in to **Streamlit Community Cloud** using the **same GitHub account** that you used to create and upload your deployment repository. This ensures Streamlit can access the repository you will deploy.

Step 4. Connect your GitHub account

Click **Create app**. If prompted, select **Connect to GitHub**, then authorize Streamlit to access your GitHub account. Once authorization is complete, Streamlit will be able to access your repositories for deployment.

Step 6. Deploy your app

[← Back](#)

What would you like to do?

Deploy a public app from GitHub

My code is ready on a GitHub repo, and it is totally awesome.

[Deploy now](#)

Deploy a public app from a template

I want to see what kind of amazing concoctions you have for me.

[Check out templates](#)

Deploy a private app in Snowflake

I want unlimited enterprise-grade apps, with the security of Snowflake.

[Start trial →](#)

<https://share.streamlit.io/new/deploy-from-template>

Select **Deploy a public app from GitHub** and click **Deploy now**.

Deploy an app

Repository  [Paste GitHub URL](#)

 /module_repo

Branch

main

Main file path

app.py

App URL (optional)

modulerepo-iurriyjkx2uappdamypvfe .streamlit.app

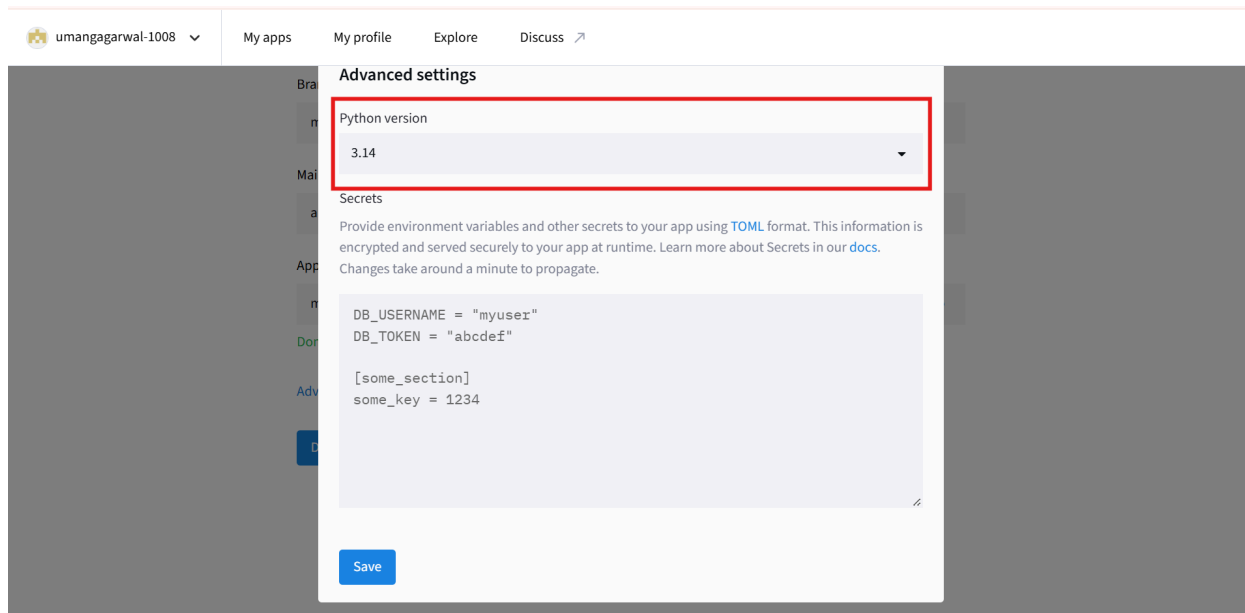

Domain is available

[Advanced settings](#)

In the deployment form:

1. Select your **GitHub repository** from the **Repository** dropdown.
2. Ensure the **Branch** is set to **main**.
3. In the **main file path**, enter the name of your Streamlit entry-point file (for example, [app.py](#)).

4. Click **Advanced settings**. In the dialog that opens, set the **Python version** to **3.12** from the dropdown, then click **Save** to close the dialog.
5. In the **Advanced settings** dialog, scroll to the **Secrets** section. Add the required application secrets in the format **KEY = "value"**. For example:

None

```
OPENAI_API_KEY = "your_openai_api_key"
OPENAI_API_BASE = "https://your-api-base-url/v1"
LANGCHAIN_API_KEY = "your_langchain_api_key"
LANGCHAIN_TRACING_V2 = "true"
LANGCHAIN_PROJECT = "your_project_name"
```

6. Click **Deploy** to start the deployment. Streamlit will build your application using Python 3.12 and provide a public URL once the deployment is complete.

Step 7. Wait for the build

Most apps deploy within a few minutes, but if your app has a lot of dependencies, it may take longer. You'll see the build logs on the right side of the screen. If something breaks, this is where you read the error messages. Common issues are typos in requirements.txt or missing

packages. Fix them in your GitHub repo, push the change, and the app will automatically try to rebuild.

Your app is in the oven

< Manage app

Step 8. Share your app

Once it's live, you've got a public URL you can send to anyone.

After the initial deployment, any changes you push to your GitHub repo are reflected in your deployed app almost immediately. So your workflow from this point on is just: edit code, upload to GitHub, and Community Cloud picks up the changes automatically.

Additional Note

You can manage your deployed apps, check logs, reboot, or delete them all from your workspace at share.streamlit.io. For the full official walkthrough, the [Streamlit Community Cloud docs](#) cover everything in detail.
